

MKT MACHINING

Aluminum Rail Mount Level Instructions

Thank you for purchasing our product, and make sure to check back for new products, both printed and CNC machined from aluminum. This level is machined from aircraft-grade 6061 Aluminum then Type III Hardcoat Anodized for a highly durable product.

Installation of this level is quick and easy. Separate the two halves, and install on your picatinny rail using approximately 15 in/lbs of torque. For a right-handed shooter, you would typically have the level vial on the left side of the rifle and vice versa for lefties. Because of the opening in the top of the lever, you may want to put the level in a spot where it can gather as much light as possible, rather than under a focus or windage knob.

Go shoot! Now you know your rifle is level.
