

# MKM MACHINING

## Gen III Magneto Mount Updates

**There are two small design updates noted in this supplementary instruction sheet:**

- 1) Rather than shipping a 24" rod, we now have modular 12" sections that are threaded on both ends. This greatly eases shipping security, and also allows for 36" of rod for extremely long barrels. To link your rod sections together thread the included 5/16 set screw into the adjustment rod with a 5/32 allen wrench. Thread locker can be used if desired. Now you can attach two (or three) rods together, and tighten them with a wrench via the milled flats. Thread locker can be used if desired, although we recommend a low-medium strength if you plan to take these apart in the future.**
- 2) To mitigate bending the bracket on your Magnetospeed from overtightening, and provide a more secure grip on the adjustment rod, there is now a glass fiber filled nylon bracket attachment piece. This in conjunction with the billet bottom plate provide nearly complete surface contact with the adjustment rod, and as mentioned above will help provide support to the bracket itself. Look at the picture above a note your bolts pass through the bracket and glass nylon piece, then thread into the billet plate to capture the adjustment rod. Enjoy shooting with no POI shift!**
